

Desert Greening

Drought Abatement and Desert Greening

Through

Integral Healing of Environment

Madjid Abdellaziz (Engineer)

**Cultivation of arid regions through the generation of natural
rain and life-energetic activation of water, soil and plants**

This brochure will inform you about something unusual.

You will learn that it is possible to generate natural and sustainable rain without chemicals or electric energy, even in drought or desert regions. In this way it has become possible to drive back the desert, re-cultivate the land and recreate a healthy local and regional climate.

We, i.e. the team of Desert Greening, not only apply the technology to generate natural rain, but also make use of various tried and tested methods of life-energetic activation of water, soil and plants. This interaction creates a basis for an extensive recovery of nature – even in areas where the natural habitat has largely collapsed, i.e. in deserts.

The blue orgone (life energy) envelope of our planet
(seen from the surface of the earth as "sky")

Indeed, more than 2/3 of the surface of the Earth – or as we also call it, the Blue Planet – consists of seawater. For humans, however, seawater is not of much use – unless it has been desalinated in an arduous process. Yet, on a global scale, vital fresh water is unevenly distributed. Whereas there are regions where there is fresh water in abundance, other areas are plagued by droughts. If the vital rain does not appear, people will start migrating. Because of the spreading of deserts, fertile land gets lost since decades, and the desert seems to expand irresistibly. However, this process only seems to be irresistible. An integrated healing of environment, including the generation of natural rain, can stop this process and turn it around. The desert will once again become a habitable area and land endangered by droughts will no longer be lost. This means that with regard to future generations a solution has been found for an old problem.

About the Technology to Generate Natural Rain

The technology of "Life Energetic Weather Work"¹ was developed by the Life Energy researcher Wilhelm Reich (1897 – 1957) over several decades and implemented in the USA in the 1950s. Reich initially discovered the Life Energy (which he called "Orgone") in human beings, but later also in other living organisms. The free flow of Life Energy is the basis of natural self-regulation and self-healing. Once the natural flow is blocked, the result is a basic dysfunction which leads to symptoms of disease – and may even lead to structural disintegration. A gentle dissolving of the blockade stimulates self-healing processes – in whatever living system it may be.

Wilhelm Reich also regards the Planet Earth as a huge living organism – surrounded and permeated by Cosmic Life Energy, which flows around the planet as a bluish glowing and highly sensitive envelope (whose interior appears us as the blue sky – seen from the earth surface). The basic form of movement of the Life Energy (in all its dimensions in macro-, meso- and microcosmos) is the spiral or vortex – and is found in the atmosphere (and on satellite images) as low pressure cyclones on whose fronts clouds and rain develop. If the Atmospheric Life Energy of the earth is largely blocked², the affected territories are no longer permeated by cyclones and there will be an absence of clouds and rain (or snow). The consequence will be aridity and drought (often accompanied by heatwaves), which in the long run will result in the development or spreading of deserts – which seems to be a major cause of "global warming".

¹ Reich called it "CORE"(Cosmic Orgone Engineering), "OROP" (Orgone Operation) or "Cloudbusting".

² Reich called this blocked or stagnant life energy „DOR“ (Deadly Orgone).

A life energetic blockade of the atmosphere can be dissolved by some kind of "Atmospheric Acupuncture" (Himmels-Akupunktur), which can reestablish climatic self-regulating and self-healing processes – and induce rain in arid, drought or even in desert regions. Reich called the device which he developed for this application "Cloudbuster" and the method of application "Cloudbusting" (a little bit misleading, because it can be used to induce cloud building and rainfall). He applied this unusual technique during the 1950s after several experiments successfully in the desert of Arizona (USA), and intensive rainfalls then developed. His pioneering research remained unknown to the public for a long time, however it was eventually taken up by a few scientist, who rediscovered this work of Reich and reproduced several of his basic experiments and published about Reichs work (e.g. Dr. James DeMeo³ in the USA and myself⁴ in Germany). Meanwhile it has become more and more clear that the rediscovery of Life Energy by Reich and others⁵ also offers previously unimagined possibilities for an integral healing of environment and climate⁶.

I myself was witness of the application of "Cloudbusting" to overcome dramatic drought situations, e.g. in Namibia (1993) and Eritrea (1994 – 1999) – under the direction of Dr. James DeMeo, where I could do a lot of photographic and video documentation of this work before, during and after the operations. Furthermore I accompanied the project of Dipl.-Ing. Madjid Abdellaziz in Algeria (starting in 2004) up to now from the distance (a visit in Algeria will soon follow) and monitored it through photographs, video recordings, satellite pictures,

³ James DeMeo founded a private research institute ("Orgone Biophysical Research Laboratory", www.orgonelab.org dedicated mostly to the work of Wilhelm Reich.

evaluation of weather and climate data as well as personal contacts. I am deeply impressed by the changes of climate, environment and agriculture in the Sahara desert that have already been brought about so far - and by the promising perspectives offered by desert greening and healing of environment and climate. The project could become a model also for other parts of the world - and it should be supported by any means possible.

Applications up to Date

The technology and its application for the generation of natural rain have been known for many decades. The scientist Wilhelm Reich tried, and successfully implemented, the technology for the first time in 1954 in the desert of Arizona, USA. In the following decades the technology was further developed and improved.

Under the direction of Dr. James DeMeo (US) and the participation of Prof. Dr. Bernd Senf (see photo left) the technology was successfully applied to overcome droughts in Namibia in 1993, and from 1994 -1999 in Eritrea.

Mr. Abdellaziz (engineer) has been further developed and improved this technology continually since the 1990s. Since 2002, he has been applying it regularly within the framework of a model project for desert greening and re-cultivation in El-Haouita, Algeria. The project is being monitored and documented by Prof. Dr. Bernd Senf.

The technology to generate natural rain has shown its effectiveness. It does not need electric energy or chemistry. It hardly needs any infrastructure. The machine itself can be transported on a pick-up truck and is ready for immediate use in a short time. On this basis many future applications are possible.

Madjid Abdellaziz (engineer)

Project OROP El Haouita/ Algeria 2004 / 2007

In 2003, Algeria experienced a previously unknown continuous drought. Due to the general shortage of water the government even considered importing drinking water on ships. The water reservoirs in the country were in dangers to run dry. Even today one can still read about those times in the local press. Two-thirds of Algeria are already desert, and water has traditionally been a rarity. The expansion of the desert to the north has been observed already for decades. We had to act fast. At that point in time I had the necessary technology and know-how available to abate the drought. As a native Algerian I also felt responsible to assist my country by all means possible. That was done with some success. Since then, it has been raining again throughout central Algeria. Nature, soil, water and plants have visibly recovered in El Haouita, and Algeria in general.

Future Application Possibilities

The future application possibilities for the technology to generate natural rain go far beyond the re-cultivation of the desert.

Deserts and Arid Areas

Inducing natural rain in deserts or dry areas is a precondition for regaining the soil for agriculture, forestry and re-settlement, and for creating jobs. In this way such areas can be regained for human use.

Agriculture

Rain is a precondition for agriculture. Drought periods can be “bridged” through the generation of rain. Another objective is the creation of a micro-climate that will produce necessary rain in the future all by itself. As a result, the existing infrastructure will survive, but that's not all.

It will also be possible to avoid the huge financial and social burdens that go hand in hand with the loss of arable land and the migration of the population.

Settlements, Villages and Oases

The generation of natural rain in these areas does not only bring water – another effect is a pleasant climate. The temperature decreases, air moisture increases, the use of air conditioners will be reduced. Housing and the quality of life in general will improve.

Landscape Gardens, Natural Reserves, Resort Areas

These areas call for an intensive irrigation system. The use of technology for the generation of natural rain makes it possible to reliably generate rain in these areas and reduce the dependence on artificial irrigation .

Lakes and Potable Water Reservoirs

Dried-out lakes as well as reservoirs for potable water can be filled with rain. In the course of this process, the general groundwater level will also rise again.

Wildfires and Bush Fires

Wildfires and bush fires cause immense damage to flora and fauna. Houses are lost, the infrastructure is damaged, and land becomes

uninhabitable. The large-scale preventive generation of extensive rain over dry forests and bush areas helps to prevent droughts and, at last, sustainably counteracts the formation and extension of such wildfires.

Further Questions

For more than ten years I have devoted myself to the development of the technology to generate natural rain. During this time many people accompanied me on the way and assisted in making the work and finally the success possible. A big thank you to all of you.

A special thanks to my wife, who strengthened my believe in the success of my work even during difficult times.
